

Effects of surface waves on SSH ... results from theories and models

and roughness for interpretation of SSH signals

B. Chapron, F. Ardhuin, P. Dubois, N. Rascle

With precious help from S. Gille, D. Menemenlis, J. Gula & C. Rocha

a story of known knowns, known unknowns and ... ?

θ

1. Geometric sea state bias

Several effects lead to an apparent mean sea level different from the truth :

- 1. More power is returned from **horizontal** facets... these are **lower**
- 2. SAR-induced displacements
(see Rodriguez et al. recent efforts)

θ

Here we focus on first effect. Same as nadir altimeters

A rule of thumb is that **$SSB \sim b H_s$** ... with **$b \sim 0.03$** .

Why H_s ? Because it is commonly measured...

Is b constant ? No, **b** is only constant if the wave slopes are constant

- (scaling of wave surface geometry)...

→ we need to measure H_s for SSH estimates.

1. Direct wave elevation at ~ 15 km Infragravity waves

1 $\text{cm}^2 / (\text{cyc} / \text{km})$ exceeded 10% of time off mid-latitude west coasts.

Ardhuin et al. 2014

Rawat & al. GRL 2014

1. Geometric sea state bias

First : how fast does H_s varie spatially ?

Second : is b having strong spatial gradients too ?

Back to Minster et al. (1992) :

(see also Fu & Glazman ...
up to Tran et al. 2010)

1. Geometric sea state bias

Small scale gradients of Hs

First : how fast does Hs varie spatially ?

New result : small scale gradients of Hs are due to currents !

(Ardhuin et al., in prep., using same wave model as Ardhuin et al. JPO 2012)

Current from MITgcm

Hs from WW3 using current

Hs from WW3 : no current

1. Geometric sea state bias

Small scale gradients of Hs

First : how fast does Hs varie spatially ?

New result : **small scale gradients of Hs are due to currents !**

Hs spectrum follow current : $k^{-2.5}$

→ **note that short waves ($T < 6$ s) roll off slower**

If the Hs error is 10 % what is the spectrum of that error?

If one value for full swath

→ **error spectrum = Hs spectrum**

→ **error @ 100 km ~ 10 cm² / cy/ km**

→ **error @ 10 km ~ 0.01 cm² / cy/ km**

... OK, Hs > 2 m (Drake passage)

But what about true gradients of current ? Not a *model* ...

→ **how many estimates of Hs needed ?**

1. Geometric sea state bias

Small scale gradients of Hs

First : how fast does Hs varie spatially ?

What about Hs ~ 2 m ? moving to east coast (ROMS model by J. Gula)

1. Geometric sea state bias

Small scale gradients of Hs

First : how fast does Hs varie spatially ?
What about Hs ~ 2 m ?

→ error @ 100 km ~ $20 \text{ cm}^2 / \text{cy} / \text{km}$
→ error @ 10 km ~ $0.002 \text{ cm}^2 / \text{cy} / \text{km}$

1. Geometric sea state bias

Small scale gradients of Hs

Now, what about **b** ?

- theory for **b** : Longuet-Higgins (1963)
- → 3rd order moments of the wave spectrum
- Measurable proxies :
 - - the **surface Stokes drift**
 - (related to **Doppler Centroid**)
- the **mean square slope**
- (related to **radar backscatter**)

Uss map → spectrum : k^{-2}

mss map → spectrum : $k^{-1.5}$

Recommendations for the OBP?

... and others ...

1) Small-scale variations in H_s are dominated by currents

- Not taken into account in SWOT error budget.
- Seems important around 100 km : resolved by 3 points cross-swath ?
- How many points of H_s needed cross-swath ?

2) SSB is not just H_s

- Measurable proxies are probably :
 - **cross-sections**
 - **Doppler centroids**

More work to do : use real current gradients → estimated with glitter
use real waves → drifting buoys

A case for **synergistic science**

- Upper ocean mixing (Langmuir ...)
- (Stokes drift is proportional to Doppler centroid anomaly near-nadir)
- Wave-current interactions
- Ice-wave-current interactions ...

Known for C band.... True also for Ka band

EM Bias for SWOT with the hands

The sea surface being a collection of facets, each one having its own inclination and roughness.

1 weighted facet in the complex plan

All weighted facets contributing to 1 SWOT pixel

Case 0: Uniform $\sigma_0(r, t) = \overline{\sigma_0}$, $\langle h(r, t) \rangle = 0$

EM Bias for SWOT with the hands: linear/tilt

EM Bias for SWOT with the hands: non linear/tilt

EM Bias for SWOT with the hands: linear/roughness mod.

NB, the effects of non-linear waves and roughness modulation are additives.
